

Mastitis treatment in Dairy Cows

Test Protocol:

1. Identify cow with mastitis and record which quarter is affected.
2. Take a milk sample of the affected quarter in a sterile tube (refridgerate tube) Mark tube with cow number and “before”
3. Treat affected quarter with Quantum Silver Intra Mammary tube for 2- 3 days, till milk looks normal.
4. Take another milk sample in a sterile tube and mark with cow number and say “after”
5. Send samples to Lab for bacterial culture and identification.
6. Milk withdrawal after last treatment is 24hrs.
7. Record any other relevant information of the cow: e.g. previous infection, repeat case etc

Quantum.Silver Intra Mammary is a clear liquid and contains no colourants. Milk is safe for human consumption as soon as the milk appears normal again.

Treatment:

Quantum.Silver Intra Mammary 1 tube every 12 hrs till milk appears normal again.

General disinfection and hygiene remains important at all times.

Safety:

Quantum.Silver is a very safe product.

Store the product at room temperature and away from direct sunlight.
